

# Agile Quality Management

# Agile Manifesto Values

<b>individuals and interactions</b>	<b>over</b>	<b>processes and tools</b>
<b>working software</b>	<b>over</b>	<b>comprehensive documentation</b>
<b>customer collaboration</b>	<b>over</b>	<b>contract negotiation</b>
<b>responding to change</b>	<b>over</b>	<b>following a plan</b>

# Quality Management Goals

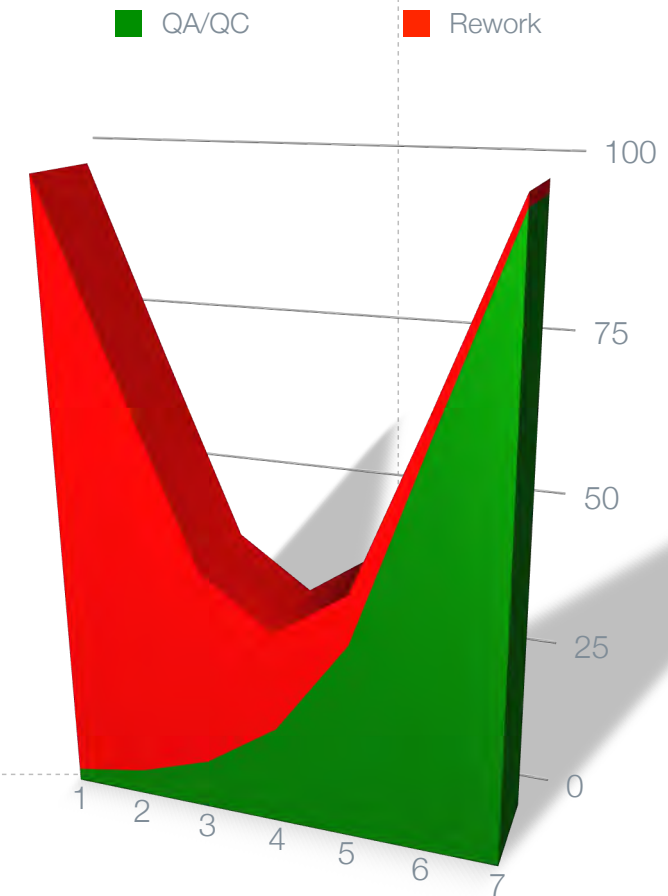

- ❖ Customer Satisfaction
- ❖ Leadership
- ❖ Involvement of People
- ❖ Process Approach
- ❖ System Approach to Management
- ❖ Continual Improvement
- ❖ Factual Approach to Decision Making
- ❖ Mutually Beneficial Supplier Relationships

ISO 9001:2000

# Quality is...

- ✿ The totality of characteristics of an entity that bear on its ability to satisfy stated and implied needs (ISO 8402)
- ✿ when the customer returns – and not the product... (corporate slogan)
- ✿ free (Philip B. Crosby)

# What has Changed?

Traditional Wisdom	Agile Perspectives
Strict change management	Change is inevitable
Comprehensive documentation	Working software is more important. And face-to-face communication is even better
Up front planning	Plan to the next iteration
Formal entrance and exit criteria with signoffs	Collaborate, don't hand-off
Comprehensive system-level regression tests	Detect defects earlier with automated unit tests and continuous integration

# The Rhythm of Agile Projects

# Down the Waterfall?

Requirements

Analysis

Design

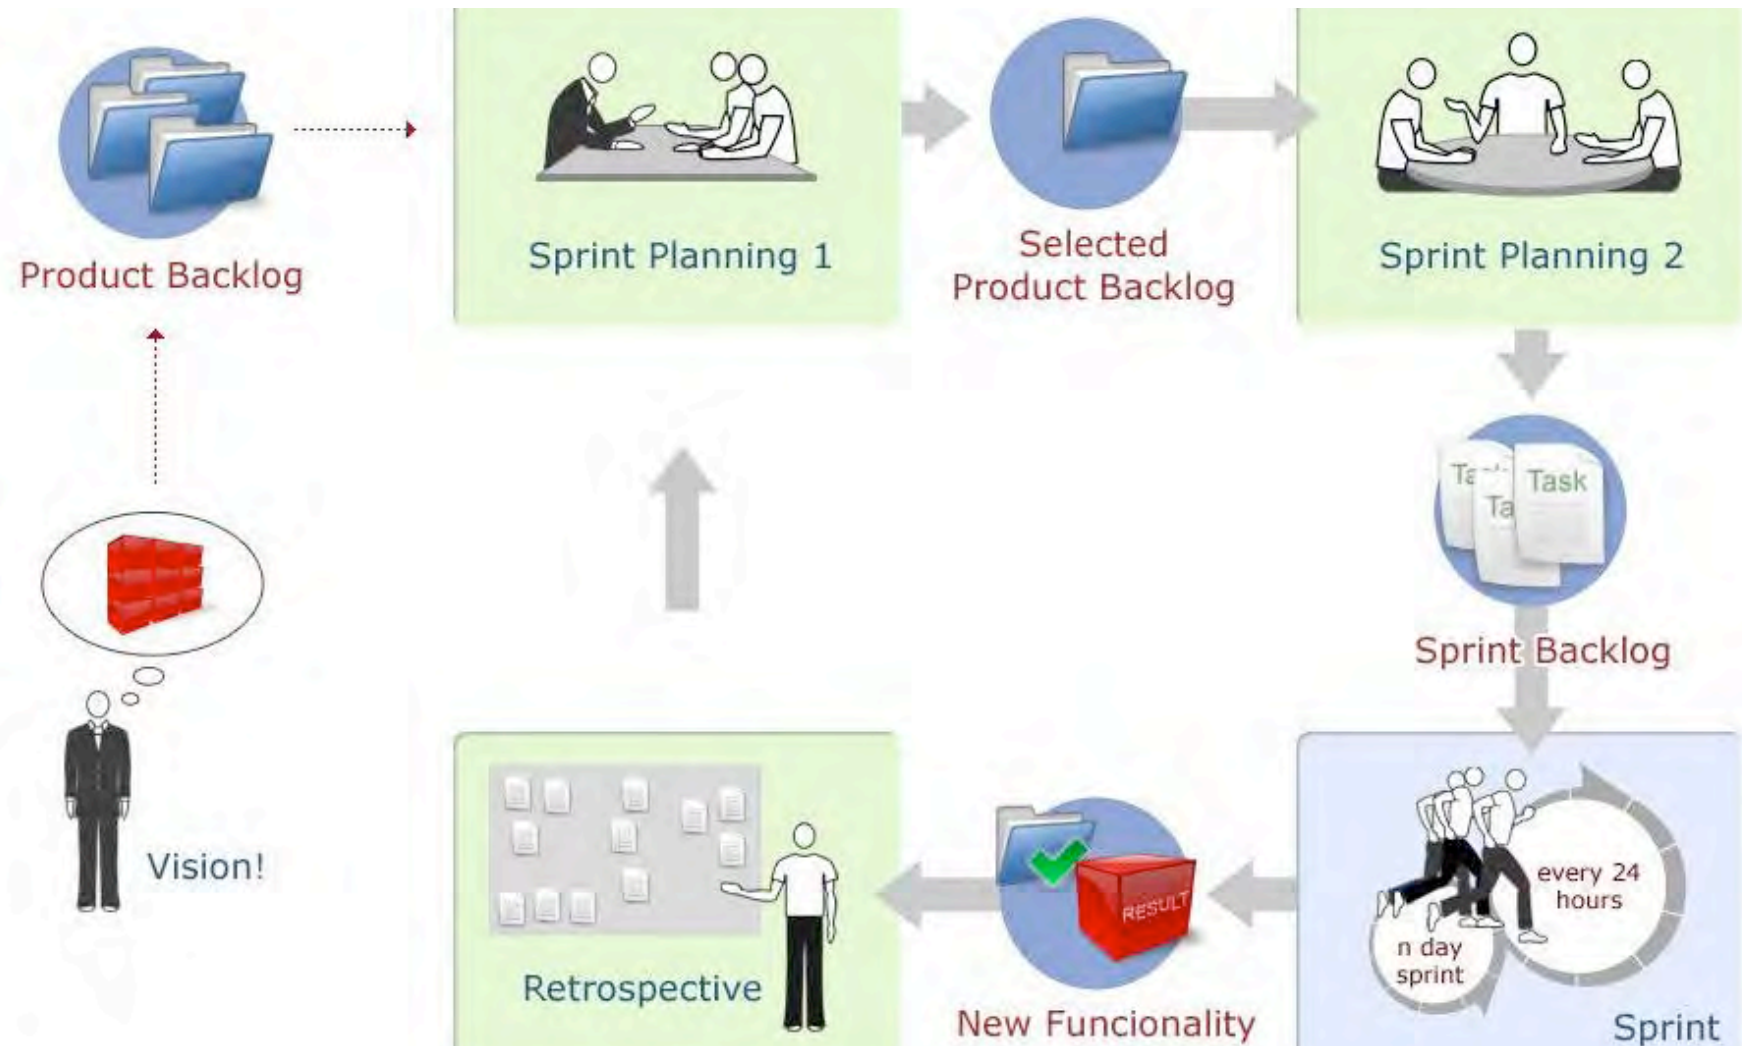

Coding

Testing

Operation

# Scrum Flow

# Agile Development

# The Deming Cycle

# *Plan* for Quality

- What is your definition of quality?
- How do you know you have reached it?
- What has to be tested when?
- How can the tests be performed?

# *Do* the Thing Right

- ❖ Quality awareness
- ❖ Customer Collaboration
- ❖ S.M.A.R.T requirements
- ❖ User acceptance tests vs. system tests
- ❖ Continuous Integration
- ❖ Test Driven Development
- ❖ Coding Standards

# *Check* Where You Are

Test Results

Code Quality

Progress

Team Capability

Team Velocity

Customer Satisfaction

Yourself

# *Act* Immediately

- Establish process framework
- Teach quality consciousness
- Enhance communication
- Reduce defect count

Institutionalize Change

# Quality Coaching

# ScrumMaster vs Quality Manager

ScrumMaster	Quality Manager
takes care about quality	takes care about quality
facilitates process	facilitates process
result oriented	result oriented
protects the team	protects the quality
solve impediments	observe issue management
increase performance	decrease defects
guide and coach	observer and controller

# First steps for Agile QM

- ❏ Learn agile methods
- ❏ Identify problems
- ❏ Establish practices
- ❏ Inspect and adapt

# Process Improvement

# Retrospectives

- What went well and should be kept?
- What went wrong and should be dropped?
- What did we learn?
- What do we have to analyze?
- What do we have to discuss?

# Impediment Backlog

- Team Level
- Group / Program Level
- Organizational Level

# Requirements, Estimations and Acceptance Criteria

# Agile Specification

❏ An agile specification is a prioritized list of ...

❏ User Stories

❏ Use Cases

❏ Feature Description

❏ Bugs...

❏ In Scrum known as Product Backlog

❏ The Product Backlog is a living document

# Non Functional Requirements

- ❏ Non functional requirements can be
- ❏ ... defined in the product backlog
- ❏ ... defined in the project vision
- ❏ ... part of the company standards

# S.M.A.R.T.

- Specific
- Measurable
- Achievable
- Relevant
- Timed

# User Stories

... promise for a future conversation.

# Acceptance Tests

- ✿ Owned by customer / Product Owner
- ✿ Written together with the customer / user, Product Owner, developer and tester
- ✿ About the what and not the how
- ✿ Expressed in the language of the problem domain
- ✿ S.M.A.R.T. ...

# Metric Dimensions

# Basic AQM metric toolbox

## Business Value

- Build up charts
- Non functional BV

## Process Quality

- Acceptance %
- Velocity

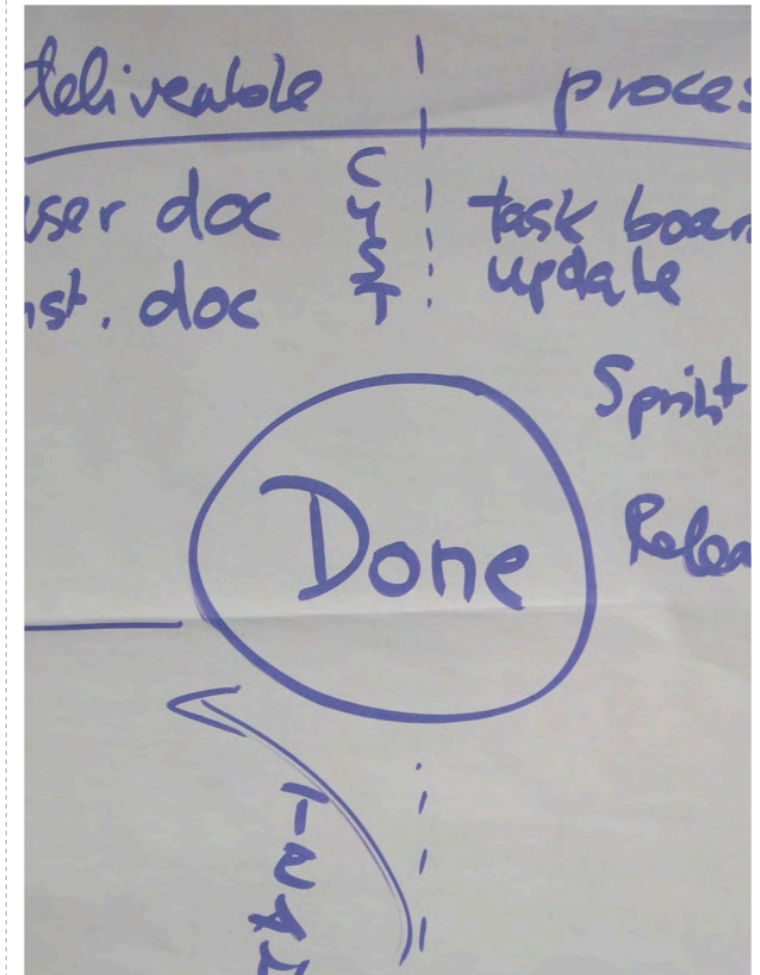

## Engineering Quality

- Code Metrics

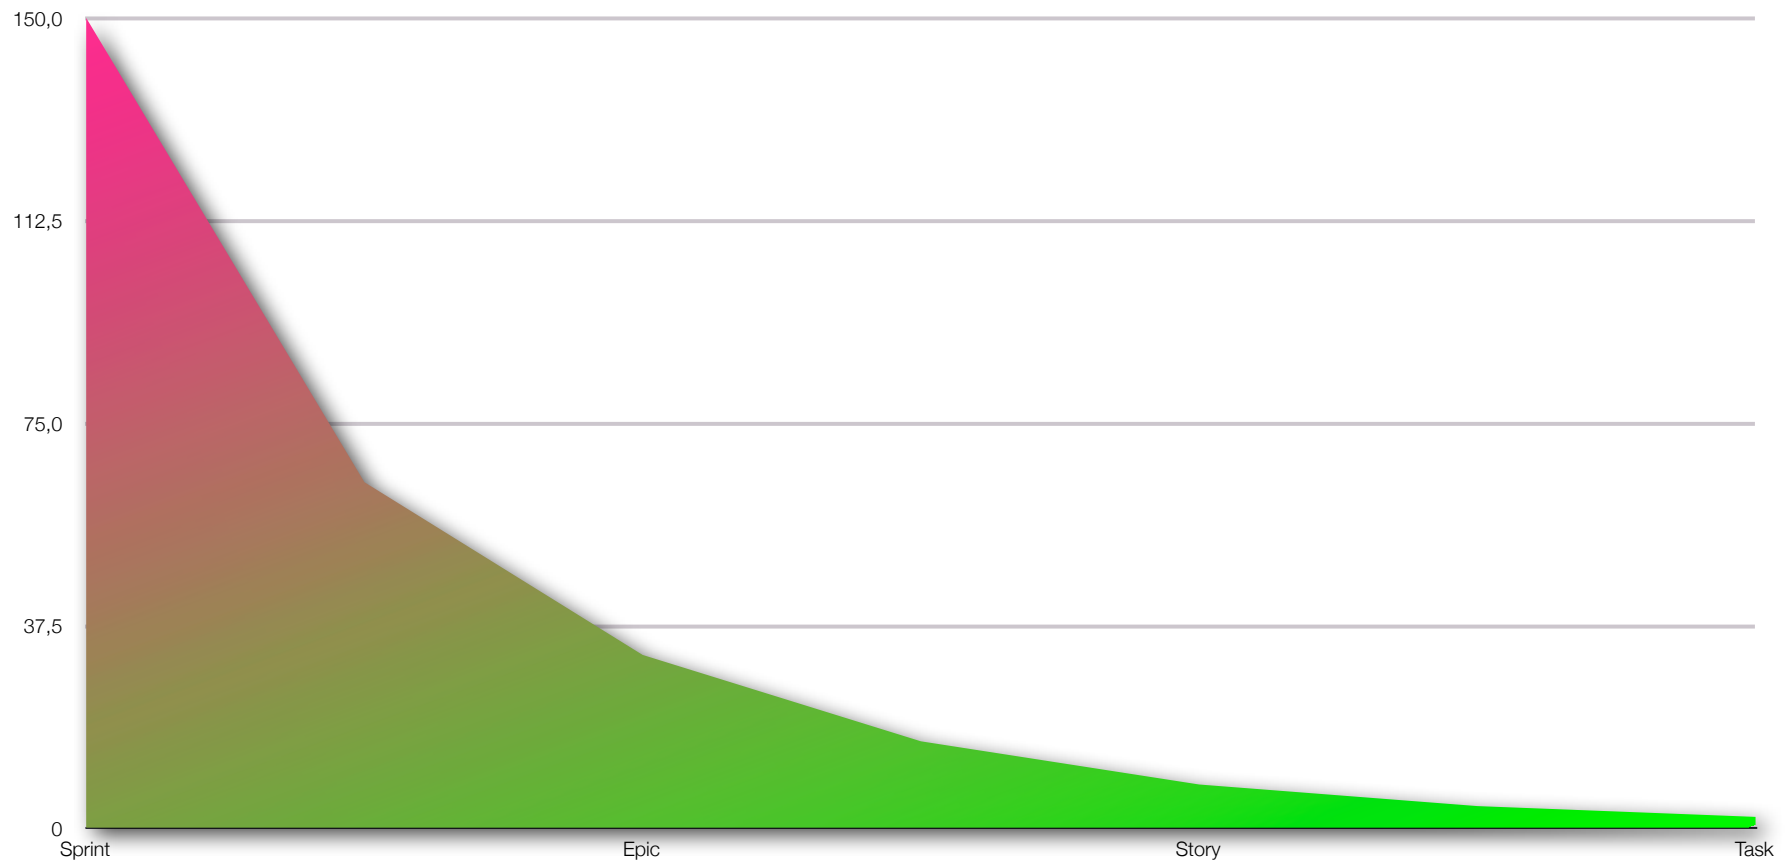

# Potentially shippable

- 🔥 Developed
- 🔥 Built
- 🔥 Integrated
- 🔥 Tested
- 🔥 Documented
- 🔥 ?

# Story Size

# Person days to implement

# Business Value Build Up

# Team Velocity

# Acceptance %

# Report Progress

- Planned product backlog and releases.
- Revised product backlog and releases.
- Complete analysis of any changes in backlog, priorities, estimates
- Analysis of productivity
- Progress toward release
- Actions to improve

# Metric Pitfalls

Velocity is compared between teams

Velocity is used to push work into the team and create technical debt

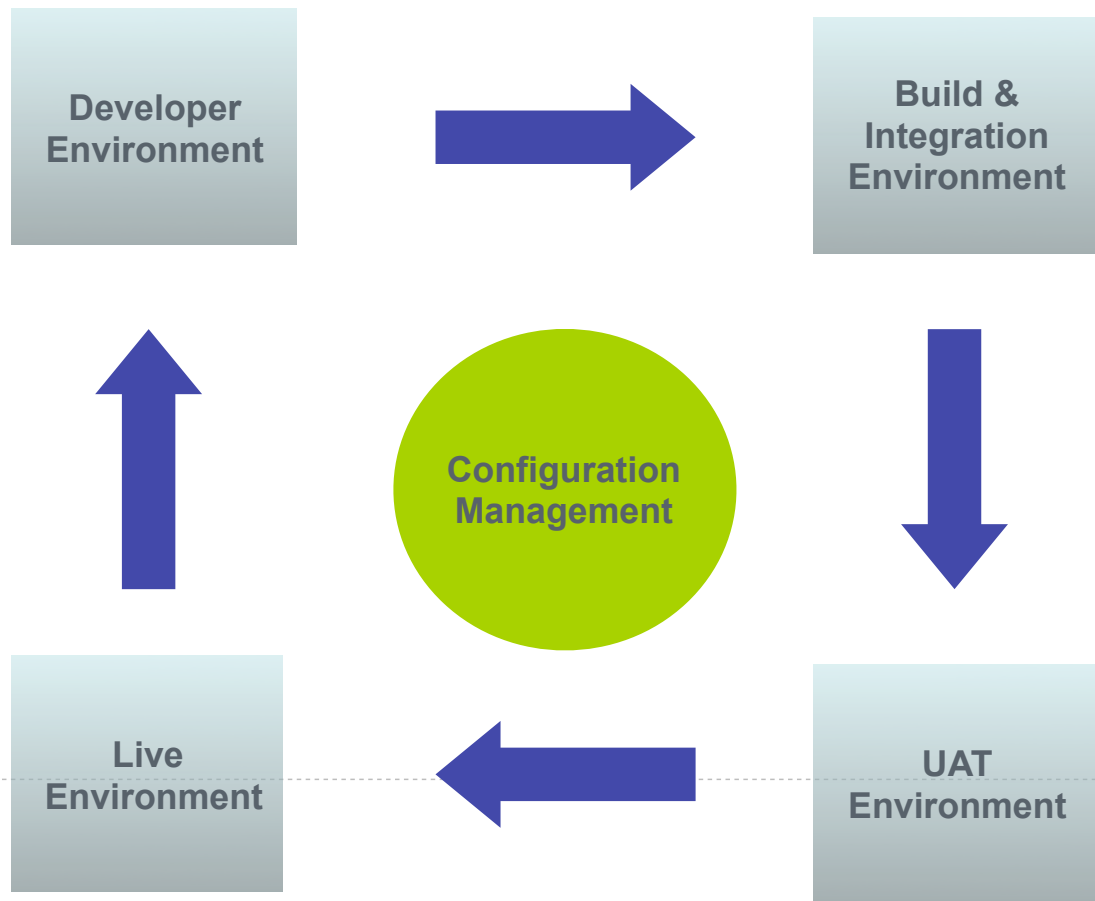

Business value gain can be low in early and late iterations

Low acceptance can be an indicator for bad delivery or bad requirement quality

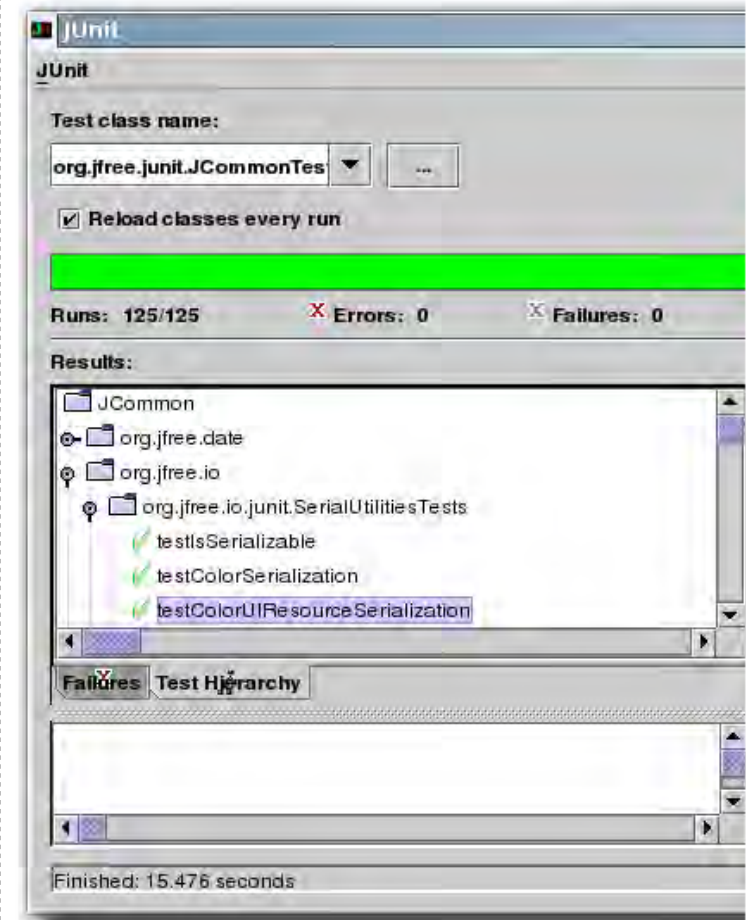

# Continuous Integration

# Testing

- Acceptance tests for stories
- Unit tests for components
- Automated integration testing
- Test to find bugs!

# Release Management

- ❖ Release Plan
- ❖ Responsible persons
- ❖ Rollout and roll-back plan
- ❖ Tagging, branching, merging
- ❖ Verification

# Collaboration

## Work on metrics

- Apply any metrics that appear useful

## Establish continuous integration

- Ideally a shared CI system

## Establish frequent reviews

- Does the quality of the deliverable meet your requirements?

## Allow both sides to improve

-  perform frequent retrospectives

# Scenario: Game Portal

- ❏ Test automation developers, testers and developers form one team
- ❏ Initial resistance from developers to take testing tasks
- ❏ Testers closely integrated into team, automation developers work separately
- ❏ Cooperation is managed by the team in their Daily Standup sessions
- ❏ Testers manage the testcase batches for automation
- ❏ New functionality is still tested manually

# Exercise: Self

- ✿ Identify actions or activities that would improve the quality of the deliverables
- ✿ Think about the positive impact each activity would have
- ✿ Think about the effort each activity would take - S/M/L/XL/XXL
- ✿ Prioritize the activities
- ✿ How much could you reach in one month?

# Thank You
